

## **Another Quake Shook North-east Japan**

In the early morning of March 23, another earthquake, scaled 5.4, took place in north-east Japan, 73 km south to Fukushima. So far no toll resulted from the quake has been reported, and neither has it roused any tsunami alarm.

The depth of the epicenter was scaled 15.7 km underground. Responders at the nuclear plant were endeavoring to stop the radioactivity from leaking while the quake occurred. And according to the Tokyo Electric Power (TEPCO), the quake didn' t cause any further damage to the reactors.

Power to the six reactors and illumination of the third reactor at the nuclear plant have been restored since March 22.
